Disseminated *Fusarium* bloodstream infection in a child with acute myeloid leukemia: A case report

Disseminated *Fusarium* bloodstream infection

Abstract

BACKGROUND

Disseminated *Fusarium* is rare in healthy children. Children with hematological tumors may have secondary fungal infections, including *Fusarium* infections, which are due to tumor bone marrow infiltration or prolonged bone marrow suppression after chemotherapy. Because of the lack of typical clinical manifestations and effective antifungal drugs, early diagnosis and treatment of the disease are difficult, and the prognosis is poor.
