Scapular fracture

- Symptoms
- Diagnosis
- Causes
- Treatments

A scapular fracture is a fracture of the scapula, the shoulder blade. The scapula is sturdy and located in a protected place, so it rarely breaks. When it does, it is an indication that the individual was subjected to a considerable amount of force and that severe chest trauma may be present. High-speed vehicle accidents are the most common cause. This could be anywhere from a car accident, motorcycle crash, or high speed bicycle crash but falls and blows to the area can also be responsible for the injury. Signs and symptoms are similar to those of other fractures: they include pain, tenderness, and reduced motion of the affected area although symptoms can take a couple of days to appear. Imaging techniques such as X-ray are used to diagnose scapular fracture, but the injury may not be noticed in part because it is so frequently accompanied by other, severe injuries that demand attention. The injuries that usually accompany scapular fracture generally have the greatest impact on the patient's outcome. However, the injury can also occur by itself when it does, it does not present a significant threat to life. Treatment involves pain control and

[Glenoid fractures: which ones can be fixed through the ...](#)

<https://aoj.amegroups.com/article/view/5819/html> ▾

Oct 15, 2020 · Traditionally, fractures of the glenoid were treated through either an open deltopectoral approach for **anterior fractures** or a Judet approach for posterior **glenoid fracture** and **fractures** that involve the scapular neck and spine . These approaches, while reliable, do require large incisions, softer tissue damage, and possibly longer rehabilitation times.
