#### **SPECIFIC COMMENTS TO AUTHORS**

Authors showed reduction on the time of recovery of patients with moderate to severe COVID-19 when treated with Arbidol. In the Aims of the abstract I suggest to specify the disease. "... Arbidol against COVID-19" Methods in the abstract mentioned just one Hospital but in the main text two hospitals are mentioned. In the discussion of the main text, approximately in the ninth line, spinosin is mentioned. I think, authors want to mention Spike protein instead. I recommend in table 2, add the distribution of moderate cases. I know that is possible to infer it just taking into account the Severe cases but I think is better to explicitly show moderate cases distribution

## SPECIFIC COMMENTS TO AUTHORS

First of all I would like to compliment the authors, as the study provides important information about the potential therapeutic use for arbidol in mild-to-severe COVID-19 patients, and studies the correlation between the early use and its beneficial effect. Review: Minor review of the grammar is needed (connectors, punctuation and spacing between words). There are sentences that are redundant, hard to read or doesn't fit the context of the text. • The word "covid-19" goes in Capital letters: COVID-19 • RT-PCR section should be included in the case definition section and describe that the RT-PCR is for SARS-CoV-2. • Case definition, RT-PCR, treatment plan, discharge criteria, Participants, data collection sections, should be in methods section. • Line 79: "The prognosis is good" is redundant. • Line 80: "Approximately 1/5 to 1/10 patients will require in-patient admission, and the predictors are age and underlying disease." This sentence is hard to read, suggestion: "Approximately 1/5 to 1/10 of the patient with old age or an underlying condition will require in-patient admission" • Line 119: "Jinyintan Hospital and Huoshenshan Hospital is an infectious disease hospital in Wuhan, China. A total of 132 patients of 18 years old and over who met the Covid-19 diagnostic criteria and treatment program were included from moderate to severe patients. Excluding mild clinical forms and critically ill patients." This paragraph is hard to read, suggestion: "Patients from the Jinyintan Hospital and Huoshenshan Hospital, which are infectious disease hospital in Wuhan, China, were recruited for the study. A total of 132 patients above 18 years old, who met the diagnostic criteria for moderate to severe presentation of COVID-19, and Arbidol treatment program were included. While Mild clinical forms and critically ill patients were excluded" • Line 145: "The treatment plan is determined by the doctor on duty, with or without Arbidol , the directions for use are 200mg for adults, 3 times a day with a 10 days course of treatment and not

receiving any other drugs." this paragraph is hard to read, suggestion: "The treatment plan is determined by the doctor on duty, the directions for Arbidol use are 200mg for adults, 3 times a day with a 10 days course of treatment and not receiving any other drugs. • Line 148-152: "We looked for the early stages of sudden outbreak of the epidemic, places of limited medical resources, limited ward beds and delayed admission, so there are some patients cases naturally fit in the control group which did not receive any antiviral drugs. Compare the disease course of the two groups; and explore the predictors for long disease duration." This paragraph is hard to understand, separate and explain the variables. • Line 162: "Statistical analyses were done using the IBM SPSS Statistics (version 23.0). Compare the baseline data of the two groups" suggestion: Statistical analysis was done using the IBM SPSS Statistics (version 23.0) to compare the baseline data of the two groups" • Line 164: "compare the various factors of the long and short disease duration" suggestion: we compared the various factors of the long and short disease duration. • Line 171: ". Use single and multi-factor analysis to analyze the independent risk factors that affect the course and duration of disease" this sentence is redundant, suggestion: we used single and multi-factor analysis to study the independent risk factors that affect the course and duration of disease. • Line 177: "Effects of using Arbidol, Divided into intervention group: 72 patients who used Arbidol; control group group: 60 patients who did not receive any antiviral drugs". suggestion: In order to analyze the effects of using arbidol, we formed 2 groups of study: intervention group: 72 patients who used Arbidol and control group: 60 patients who did not receive any antiviral drugs. There are multiple studies regarding the still controversial effect of arbidol (umifenovir), a comparison between the findings in the study and the results of contraposition articles, can further improve the quality of the discussion section in the manuscript. Suggested bibliography: • Evaluation of current medical approaches for COVID-19: a systematic review and meta-analysis; Meng Wang, Ting Wu, Zhihong
