Generalized periodontitis treated with periodontal, orthodontic, and prosthodontic therapy: A long-term case report

Comprehensive dental treatment for generalized periodontitis

Abstract

BACKGROUND

Generalized periodontitis is a severe periodontal disease characterized by rapid periodontal destruction in healthy persons. This case report describes the treatment of a severe crowding, large overjet, and occlusal collapse due to the loss of anterior guidance with generalized periodontitis.

CASE SUMMARY

A 25-year-old female patient with a chief complaint of crowding and maxillary

A 26-year-old man with an aggressive periodontitis sought for orthodontic treatment to improve the appearance of his smile. He presented with generalised anterior spacing, missing lower left central incisor and deep traumatic bite. He was treated successfully with a combination of orthodontic and periodontal treatment.

Introduction

Clinical Features

Radiographic Features

Generalized aggressive periodontitis results in rapid destruction of the periodontium and can lead to early **tooth** loss in the affected individuals if not diagnosed early and treated appropriately. The diagnostic features of the disease are characteristic, but the clinical presentation and patterns of destructions may vary between patients. Successful management of the disease is challenging especially if diagnosed at advanced stages of the disease, but not impossible with the current therapeutic choices for the disease...
