Bleeding into the peritoneal cavity (hemoperitoneum) is one of the complications of chronic peritoneal dialysis (PD). It is a life-threatening condition that can be caused by various factors, including abdominal trauma, anticoagulation, and abdominal aortic aneurysm (AAA). AAA is a localized dilation of the abdominal aorta, which can rupture and cause hemoperitoneum. The diagnosis of AAA is often made by ultrasound or CT scan. The treatment of AAA depends on the size and location of the aneurysm, and may include medical management or surgical repair.
