Impact of COVID-19 on the clinical statuses of patients with Wilson disease

Yu-Pei Zhuang, Hao-Jie Zhong

Abstract

The coronavirus disease 2019 (COVID-19) pandemic has greatly impacted health systems. Many guidelines on chronic liver diseases have been released to optimize the use of medical resources and patient management. However, most of these guidelines have been established through expert consensus because the existing data do not

The primary endpoint was all-cause mortality within 30 days of diagnosis of COVID-19. We assessed the association between the outcome and potential prognostic variables using logistic regression analyses, partially adjusted for age, sex, smoking **status**, and obesity. This study is registered with ClinicalTrials.gov, NCT04354701, and is ongoing.

<https://pubmed.ncbi.nlm.nih.gov/32473681>

Race and ethnicity, obesity **status**, cancer type, type of anticancer therapy, and recent surgery were not associated with mortality. Interpretation: Among **patients** with cancer and **COVID-19**, 30-day all-cause mortality was high and associated with general risk factors and risk factors unique to **patients** with cancer. Longer follow-up is needed to better understand the effect of **COVID-19** on outcomes in **patients**
