Including results for comprehensive radiomics nomogram for predicting survival of patients with combined hepatocellular carcinoma and **cholangiocarcinoma**.
Do you want results only for Comprehensive radiomics nomogram for predicting survival of patients with combined hepatocellular carcinoma and cholangiocarcinom ?

Radiomics predict postoperative survival of patients with ...
<https://pubmed.ncbi.nlm.nih.gov/32793665>
Background: Radiomics can be used to determine the prognosis of liver cancer, but it might vary among cancer types. This study aimed to explore the clinicopathological features, radiomics, and survival of patients with hepatocellular carcinoma (HCC), mass-type cholangiocarcinoma (MCC), and combined hepatocellular-cholangiocarcinoma (CHCC).

A radiomics nomogram for the prediction of overall ...
<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC33198809>
Background. HCC is the fifth most common malignancy and ranks as the third most common cause of cancer-related death worldwide [1, 2].Surgical resection is the preferred treatment option for individuals with HCC [3].However, the long-term prognosis of patients with hepatocellular carcinoma after resection is dismal, as the 5-year survival rate is only 25–55% and the 5-year recurrence rate is ...

Background Hepatocellular carcinoma (HCC) is associated with a dismal prognosis, and prediction of the prognosis of HCC can assist in therapeutic decision-makings. An increasing number of studies have shown that the texture parameters of images can reflect the heterogeneity of tumors, and may have the potential to predict the prognosis of patients with HCC after surgical resection.
