

Reviewer 1:

NIHP is a rare event, but the etiology is puzzling in many situations. The authors present two cases of NIHF with severe fetal anemia. The etiology was infectious in the first case and autoimmune in the second. Obstetric management was correct. The CARE checklist is incomplete. The authors should suggest a differential diagnosis of NIHF according to the immunologic conditions of the patients. Was COVID-19 excluded? Can COVID-19 be involved with NIHF? Please add it in the discussion.

Dear reviewer 1, I thank you first of all for your advices. I believe they will be very constructive and could make this article more impactful. COVID-19 has not been included in the differential diagnosis because the cases described are prior to the pandemic. However, it is interesting to know that some cases of transient skin edema in pregnant women with COVID-19 have been described and I have added it to the discussion. Furthermore I revised the English language.
