Characteristics

Causes

Symptoms

Treatment

Prognosis

Mixed cellularity Hodgkin can occur at any age, although it is most common in **adults between the ages of 55 and 74**, as well as **children under the age of 14**. It is equally common in men and women. The rate of this type of lymphoma appears to have decreased in incidence between 1992 and 2011, but this may be due to the way that lymphomas are classified instead of a true decrease in incidence. It is more common in people who have an immune system that is functioning poorly, for example, in people with HIV.
