Early Reperfusion

IVT can be started earlier than MT, and in some patients, IV tPA might completely lyse proximal occlusions before MT starts. A recent meta-analysis found a complete recanalization within 3 hours after application of IV tPA in 21% of M1 occlusions, in 38% of M2 occlusions, and in 4% of internal carotid art...

Thrombus Softening and Facilitation of Successful Reperfusion

It has been hypothesized that IVT before MT may increase recanalization rates and facilitate the endovascular procedure by softening the thrombus and, thus, reduce the duration of the procedure with fewer passes of stent retrievers. However, there is a considerable between-study variance whether IV t...

Recanalization Rates in Patients With MT Failure

In a small cohort of patients, MT may be delayed or simply not feasible because of the impossibility to achieve arterial access or to reach the target occlusion. In SWIFT PRIME, arterial access was not possible in 2% of patients; in EXTEND-IA in 2.9%; in ESCAPE in 3.6%; in MR CLEAN in 5%; and in RE...
