

Reviewer #1:

**Scientific Quality:** Grade B (Very good)

**Language Quality:** Grade A (Priority publishing)

**Conclusion:** Accept (General priority)

**Specific Comments to Authors:** The management was late (about 20 days) for an acute thromboembolism and there was a slight improvement in the right kidney. However, I think it is beneficial to publish this case to keep the diagnosis of acute renal artery thromboembolism in mind, and to highlight the new methods of management.

**Answering reviewers:** thank you for your suggestion. We hope that this case report may summarize our experience of renal artery thrombosis, and help to find more new methods of treatment.
