SPECIFIC COMMENTS TO AUTHORS

1. There have been several theories trying to explain the coincidence of two completely separate primary brain tumors. Could you analyze which theory is suitable for this case?
2. Tsukamoto et al. discussed the association of meningioma and neurinoma, which could be determined genetically, since the genes responsible for the occurrence of these tumors are both located on chromosome 22. Whether this aspect of tests are carried out. This theory may also be true for this patient. If it is not tested, can you discuss it or explain the relevant situation.
