<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8121102>

Apr 30, 2021 · Introduction. Adrenocortical cancer (ACC) is a rare malignancy with mostly bad prognosis. Most cases are diagnosed late, in the presence of distant metastases (1–8). The medical treatment options for ACC are rather limited, as mitotane is the only available drug specific for the adrenal cortex and its use associated with severe side effects and a narrow therapeutic range ().

Apr 01, 2021 · She underwent emergency transcatheter arterial embolization (TAE) to stabilize her general condition before undergoing elective surgery. To our knowledge, this is the first pediatric case of a ruptured ACT treated with TAE, which has only been reported so far in 2 adult patients with adrenocortical carcinoma and adenoma [3,4]. Case description

Feb 16, 2021 · Introduction. Pediatric adrenocortical tumor (ACT) is extremely rare and has an incidence of 0.1–0.4 cases per million individuals [1]. It should be treated as a malignant neoplasm, although histopathologically, it is difficult to classify it as a carcinoma or adenoma. Rupture is a rare complication of ACTs.
