

Dear editors and reviewers:

I really appreciate you and reviewer's constructive comments on my manuscript. My manuscript "Acute pancreatitis with refractory humoral hypercalcemia caused by primary hyperparathyroidism associated with paraneoplastic syndrome: A case report and review of the literature (Manuscript Number:68931)" has been revised. I have invited a native professor to edit the language of the manuscript and correct any grammatical errors in it. The Language Editing Certificate has been uploaded. We answered the questions raised by reviewers in detail, and the replies are as follows. We sincerely look forward to receiving your reply.

### **Editor and Reviewer comments:**

**Q1: Please indicate the severity of acute pancreatitis according to the revised Atlanta classification.**

**Answer:** Dear editor, thank you very much for this insightful question. The revised classification of acute pancreatitis identified two phases of the disease: early and late. Severity is classified as mild, moderate or severe. Mild acute pancreatitis, the most common form, has no organ failure, local or systemic complications and usually resolves in the first week. Moderately severe acute pancreatitis is defined by the presence of transient organ failure, local complications or exacerbation of co-morbid disease. Severe acute pancreatitis is defined by persistent organ failure, that is, organ failure >48 h. Local complications are peripancreatic fluid collections, pancreatic and peripancreatic necrosis (sterile or infected), pseudocyst and walled-off necrosis (sterile or infected) [1]. So according to the above revised classification combined with the patient's condition, the pancreatitis should be classified as moderately severe acute pancreatitis.
