SPECIFIC COMMENTS TO AUTHORS

Although less than 10 publications included, I would still recommended to do publication bias assessment. The author can add in the limitation that due to <10 included studies, interpretation of publication bias assessment should be with caution.

SPECIFIC COMMENTS TO AUTHORS

To authors A well written good conceived manuscript focusing on bringing a higher level of evidence regarding the efficiency of a form of manual physio therapy for OA management

Comments In the abstract, the sub chapter aim could be reformulated for increased clarity and understanding while the Methods subchapter needs to be shortened, it is extensively revealed within the manuscript Introduction chapter is well written. Here it seems the aims of the work were to compare the two methods, this is not obvious nor from the title or from the abstract? Was the review meant to perform a metaanalysis on overall efficiency of the methods or to compare the two? Please specify and try to be consistent (title, abstract and introduction-wise). There is a large difference between the number of papers screened and the ones included within the study, how do the authors explain this difference? In the discussion chapter the phrase starting with By bombarding the nervous system, reads speculative. This should be, at least mentioned since no evidence exist to support the statement. The reference cited by authors makes this (speculative) supposition regarding another procedure (electric periosteal dry needling compared to physical exercise and manual therapy. Why do the authors think there is a need to compare the two methods of manual therapy since their effect and indications are somehow distinct? Would it not have been better to identify a specific feature for which one of the two works better (say, ROM, pain, improvement in ADL) ? Do the authors think this study help physiotherapists and/or orthopedist to recommend one or the other of therapies? As the authors state themselves manual therapy is...well, manual, it involves the action of a person onto another human being. Many biases can be found within this interaction of which the KOA causes,

patient fitness, age, sex, compliance to therapy as well as physiotherapist experience and skills. Can we, based on this report modify the way we employ one of the other form of manual therapy or is this just another report? It is difficult from this report to understand why the authors conclude that Mulligan mobilization has “potential” in improving QOL for knee OA patients compared to Maitland.
