SPECIFIC COMMENTS TO AUTHORS

Manuscript ID: 69851 In this clinical case publication, the authors present a case of a 46-year-old female who developed eosinophilic cellulitis ten days after the influenza shot. As relevant background, the patient had an active CLL treated with ibrutinib. Review: The authors describe most of the needed details about the patient and provide histopathologic images to support the diagnosis. The case is well structured and written, with minor style observations. The case is relevant because of the temporal association between the three possible triggers and the start of the skin disease. In the conclusion section, I suggest to mention that Well's syndrome can resolve spontaneously and systemic steroids may be useful to limit the course of the disease. I recommend to publish this manuscript in the World Journal of Clinical Cases.
