

Re: Answering Reviewers for “The epidemiology of pelvic and acetabular fractures across 12-months at a level-1 trauma centre”.

Thank you for the time taken to provide this review and for the constructive feedback received. We have addressed the following point which was raised:

1. *“The authors have described the Young and Burgess classification but not the Letournel and Judet distribution of acetabular fracture”.*

We have now addressed the omission of additional classification systems beyond Young and Burgess in the limitations section at the conclusion of the discussion.
