SPECIFIC COMMENTS TO AUTHORS

This manuscript made a comment on a previous study: "Neonatal infratentorial subdural hematoma contributing to obstructive hydrocephalus in the setting of therapeutic cooling: A case report". This comment emphasized the importance of imaging screening, laboratory and clinical follow up of the neonates during TH. The authors have also pointed out that the question that has to be answered is whether a neonate with pathological laboratory findings of his coagulation mechanism is eligible for TH initiation without prior restoration of these abnormal values. Some minor revisions were listed below. (1) The abbreviation of HIE has present twice in the article. Please also consider a list of abbreviation. (2) The author declared that "In these cases, prompt neurosurgical consultation can remarkably affect neurological outcome and prognosis for the neonates." Could the author provide a reference for this statement? (3) Some minor typo corrections are needed.
