SPECIFIC COMMENTS TO AUTHORS

Peer review report I want to thank the authors for this work. I have reviewed it carefully and found the following issues that need to be addressed before the article can progress further. I only have one major concern and rest are all minor. My major concern is that when a research question has conflicting outcomes such as the one here (CT value correlation with COVID severity), the best method to present an answer is Meta-analysis of the pooled data. The authors have done an excellent exercise when it comes to literature review and presentation of crux of each study. However, the question remains unanswered even after publishing this general review. The only way to know is to conduct a metanalysis and judge the strength of each added study and provide a finalized opinion. If the authors have a record of all literature search process and was systematic, I highly suggest them to convert it to a metanalysis if the intention is to answer the research question of interest. - The title should ideally reflect the study design, I recommend adding word Review in the title. This is helpful for literature search by other authors. - Authors have presented results of multiple studies with the conclusions made by respective study authors. I believe that for a solid review, authors of the current review should give insights from their own mind also on each study as to how the results are significant and relatable to the current pandemic, what's the importance and clinical relevance of each study? - Formatting needs to be reviewed. After presentation of studies, there is a brief discussion. Wasn't the above information part of discussion? - Conclusion does not accurately justify the whole manuscript. As I recommended above, such a conclusion can be made with a metanalysis only instead of a general review.

SPECIFIC COMMENTS TO AUTHORS

I don't think that the authors have addressed the queries raised by me. Specially the following point: Comment #3: Authors have presented results of multiple studies with the conclusions made by respective study authors. I believe that for a solid review, authors of the current review should give insights from their own mind also on each study as to how the results are significant and relatable to the current pandemic, what's the importance and clinical relevance of each study? - Formatting needs to be reviewed. After presentation of studies, there is a brief discussion. Wasn't the above information part of discussion? - Conclusion does not accurately justify the whole manuscript. As I recommended above, such a conclusion can be made with a meta-analysis only instead of a general review. Author answer: Thank you again for the valuable suggestion. If the reviewer noticed about the studies design of all the literatures which were reviewed, all of them are prospective cohorts and retrospective studies no a randomized control trial is found in the PubMed and other data bases. My query and the answer are not related at all.
