SPECIFIC COMMENTS TO AUTHORS

This case introduce a novel method for endoscopic haemostasis, here a few aspects for improving: 1. the case introduction part could be more brief, focus on the symptoms and examinations which are closely related to esophageal bleeding. 2. discussion should pay more attention on the superiority of the novel method you brought up, rather than simply illustrate the severity and intractability of the disease. 3. minor language polish.

SPECIFIC COMMENTS TO AUTHORS

1-The patient was treated with a novel method based on the use of a two-balloon catheter creating an isolated area in esophagus and locally dispersing hemostatic polysaccharide powder inside the isolated interior. Hemostasis was successful. It can be used in the treatment of patients who develop these conditions. 2-Work quality. A method of stopping bleeding with the application of double balloon catheter in esophageal hemorrhages has been described. It will contribute to the literature. 3-If this study is designed as a prospective study, not just a case study, its shortcomings and success will be better revealed.
