SPECIFIC COMMENTS TO AUTHORS

1 Title. Appropriate 2 Abstract. Appropriate 3 Key Words. Keywords should be different from the title. 4 Background. Appropriate 5 Methods. Appropriate 6 Results. Appropriate 7 Discussion. Differential diagnosis of retinal hemangioblastoma should be added. Key features to differentiate from other masses must be emphasized. 8 Illustrations and tables. The figure descriptions are careless, should be rewritten. MRI images were presented in a confusing manner. They should begin with T2 WI, after that precontrast T1WI, after that enhanced images should be presented. Are there any DWI, if present it should be given. 9 Biostatistics. N/A 10 Units. Appropriate 11 References. Appropriate 12 Quality of manuscript organization and presentation. Average, can be upgraded. 13 Research methods and reporting. Appropriate 14 Ethics statements. No information was given, were patient's consent taken?

SPECIFIC COMMENTS TO AUTHORS

The authors have described the imaging features of retinal hemangioma from a perspective of radiologist. Retinal hemangiomas can usually be observed directly and diagnosed by eye fundus examination. I suggest that this is included in the introduction, since this is the main reason why radiologists do not often perform diagnostics of retinal hemangiomas. Physical examination needs an improvement in english ophtahlmological terminology. Few examples: What is meant by "naked eye"? Perhaps: visual acuity without correction? "External eyes of both eyes"? Probably: periocular? The term "hematocele in the anterior chamber" is not correct, it should be "hyphema"
