SPECIFIC COMMENTS TO AUTHORS

- Several grammatical error in written language such as, 1. chronic kidney disease stage 5, would be better written as stage 5 chronic kidney disease - In History of present illness paragraphs, we recommend using common pain scale such as Visual analogue scale etc - we suggest to include a short paragraph regarding microbiological characteristic of Neisseria mucosa - The author mentioned the preparation of arteriovenous fistulation, we suggest to add long term plan regarding this AVF preparation whether it was prepared as peritoneal dialysis?

SPECIFIC COMMENTS TO AUTHORS

The authors report a case of peritonitis caused by *Neisseria mucosa*. This is a rare occurrence and of scientific interest, particularly because a likely mechanism of infection is proposed by the authors. The report is generally well-written and concise, presenting the case in a logical and comprehensive manner. Some aspects need clarification by the authors: what is the cause of the chronic kidney disease from which the patient suffers? On page 4 line 27, "enlarged liver or spleen" would better convey the meaning of this sentence. On page 5 line 29 and on figure 2, it is stated that there was peritoneal thickening after treatment of the infection. The authors should consider the possibility that the thickening was caused by the peritoneal infection, rather than by the treatment (which is implied in the current sentence).
