SPECIFIC COMMENTS TO AUTHORS

"Repetitive Transcranial Magnetic Stimulation Combined with Olanzapine and Amisulpride for Treatment-Refractory Schizophrenia: Analysis of Therapeutic Effectiveness and Its Influence on Cognitive Function" is an interesting paper. Study is well designed and sample size is wide. The text is strictly logical. The results are interesting and they found rTMS plus OLZ + AMI is effective and safe in the treatment of TRS, which can validly improve patients' mental symptoms, CF, and quality of life. The manuscript provided a theoretical basis for clinical treatments and could be useful for other studies in this field. I have really appreciated the discussion section. However, authors should clearly underline the limitations and drawbacks of the manuscript. Otherwise, this is a very good paper and CAN BE CONSIDERED FOR PUBLICATION.

SPECIFIC COMMENTS TO AUTHORS

This study investigated the therapeutic effectiveness of rTMS combined with OLZ and AMI for treatment-refractory schizophrenia (TRS) and its influence on cognitive function. The manuscript is well designed and written. The introduction gives a good overview about the topic and the procedures are precisely described. However, some issues have to be addressed: 1. Please revise the abstract, which needs to be revised to a structured summary. 2. In page 2, The general data of two groups of patients need to be put in the Results, which is not the material and method of the study. 3. Please add whether the study was approved by the Ethics Committee? 4. Please add the inclusion and exclusion criteria for the subjects included in the study. 5. This study is a single-center retrospective study, and more studies may be needed to verify the efficacy of repetitive Transcranial Magnetic Stimulation Combined with Olanzapine and Amisulpride in the treatment of TRS. Please add the limitations of this study and subsequent work.
