

1 Thank you for writing this case. The management of COVID-19 in a pregnant patient is challenging and needs a multidisciplinary approach. The evidence is lacking on various aspects like safety of antiviral drugs, IL-6 inhibitors, mechanical ventilation especially low tidal volume ventilation and prone positioning. I suggest to add microbiological sensitivity report of microbe identified. Consider adding these two references on the management and pathophysiology of SARS-CoV-2 in severe COVID-19.

Reply: Thank you for your comments! I have added microbiological sensitivity report of microbe identified and these two references on the management and pathophysiology of SARS-CoV-2 in severe COVID-19.

2 Figures 1 and 2 should be cited in the text. There are too many abbreviations that readers would not be aware of such as mNGS and PCT. There is no actual use of the term "COVID-19" in the case summary which makes it confusing.

Reply: Thank you! I have cited the Figures 1 and 2 in the text, and I have added the full spelling of PCT and mNGS, such as "Procalcitonin(PCT)" "metagenomic next-generation sequencing(mNGS)" .
