SPECIFIC COMMENTS TO AUTHORS

This manuscript shares a rare complication after weight loss metabolism OAGB surgery: intestinal obstruction caused by gallstones Cholecystointestinal fistula is a rare disease. This case describes a case of intestinal obstruction caused by a gallstone passing through the fistula. Interestingly, due to the reconstruction of the digestive tract during OAGB surgery, the open portion of the duodenum was not significantly affected. The timely detection of intestinal obstruction and correct first-stage treatment enabled the patient to quickly recover from discharge. There are grammar errors in some English content, especially in the imaging section of the case introduction. It is recommended to modify it to conform to English grammar expressions. Overall, this manuscript reports a very rare postoperative complication of OAGB, with a detailed description of the patient's medical history such as chief complaint, physical examination, and auxiliary examination. The use of markers on captured imaging fragments enables clear visualization of the lesion site. Although some parts need to be modified, the overall article still has some reference significance.
