SPECIFIC COMMENTS TO AUTHORS

the Authors provide a very short report of a case of hemocholecyst caused by accidental injury during RFA that induced hematemesis and melena. The case can have some relevance from an educational perspective, but it adds little to current knowledge in the field. The Authors are therefore encouraged to better clarify the relevance of the case, which appears limited at the moment. Furthermore, I think that the case description requires more efforts. 'A women in her 50s' --> don't we have the exact age? the any further information on cirrhosis? and so on.

SPECIFIC COMMENTS TO AUTHORS

It's an interesting case as well as being rare. Viewing is good. Cholecystectomy was appropriate. I believe it will be helpful to the reader.

SPECIFIC COMMENTS TO AUTHORS

Thanks for addressing some of my comments. However, I think that more information on the patient is still necessary to achieve the standards of a publication.
