**Language Quality:** Grade A (Priority publishing)

**Conclusion:** Accept (General priority)

**Specific Comments to Authors:** This study investigated the prevalence of vitamin D deficiency and its associated factors in exclusively breastfed infants in Thailand. They found that the prevalence of vitamin D deficiency and vitamin D insufficiency was 35.78% and 33.03%, respectively. Multivariate logistic regression showed that the factors associated with vitamin D status 3 were maternal vitamin D supplementation and birth weight. They concluded that vitamin D supplementation was recommended for both lactating women and their babies. One minor question: Page 8. Availability of data and materials The last sentence was not complete. The study was well-designed and well-written, and the conclusion was sound.

Answer: We rewrite our manuscript and send it to a company to polish the language by a native speaker.

One minor question: Page 8. Availability of data and materials The last sentence was not complete.

**Answer**

**Availability of data and materials**

Data generated during this study will not be made publicly available because the act of data sharing was not incorporated as part of the original study protocol.
