JOURNAL EDITORIAL BOARD COMMENTS TO AUTHORS

The present study investigated the course, laboratory, and clinical findings of COVID-19 among 414 asthmatic children. The results showed that there was a correlation between the severity of COVID-19 and asthma symptoms, as well as the course of the disease. Although the study was overall well conducted. There are some limitations of the study. 1. The analysis of the data was not comprehensive and intensive which made the study mainly descriptive. 2. The discussion was quite insufficient to reveal the internal link and potential mechanisms shared by the COVID-19 and asthma.

JOURNAL EDITORIAL BOARD COMMENTS TO AUTHORS

In this retrospective study, the authors retrospectively evaluated the course, laboratory, and clinical findings of COVID-19 among 414 asthmatic children followed up from the pediatric allergy outpatient clinic and known to have had COVID-19. They concluded that there was a correlation between the severity of COVID-19 and asthma symptoms, as well as the course of the disease. There are several issues that I would like to bring to your attention. 1. Some grammar mistakes are present, English editing is recommended. 2. This study only enrolled patients with asthma. Therefore, it might not be able to compare the severity of COVID-19 in patients with or without asthma. 3. Univariate and multivariate analysis might be used to evaluate the correlation between the severity of COVID-19 and asthma symptoms, as well as the course of the disease.
