SPECIFIC COMMENTS TO AUTHORS

Cardiac surgery is often used to treat valvular heart disease, congenital heart disease, coronary heart disease, and other heart diseases. It is characterized by complicated steps, high risk, great difficulty, a lengthy postoperative recovery period, all of which can cause emotional, cognitive, and physiological reactions in patients. In this review, the authors summarized the applicable preoperative, intraoperative, postoperative, and perioperative nursing intervention methods to provide a reference for clinical practice. This review is overall well written, and the information conveyed is vitally important for improving the health and quality of life of patients. Comments: 1. The manuscript requires a minor language editing. 2. The image should be improved. 3. The references should be updated.
