Comment 1. Keywords Consider some additional MeSH keyword to readers easier identify our research (e.g., Cognitive Dysfunction; Cognition; Cognition Disorders). Discussion.

    A. We searched by adding search terms to reflect the opinions given by reviewers, but at least 300,000 studies will be added. It could not be added because there was a risk of bias that would produce results different from the direction of this study. This study was conducted as faithfully as possible because it was searched considering Patient I (cognitive rehabilitation) presented by Meta.

Comment 2. Please state the main finding of your study in the first sentence of Discussion. To further emphasized the usefulness of cognitive rehabilitation, I recommend you to include in your Discussion the recent finding of Glumac et al (Med Sci Monit, 2019) who showed that a short preoperative cognitive training regime may reduce rates of cognitive decline following surgery.

    A. The comments were reflected in the review.
