<input type="checkbox"/> Grade E: Poor	<input type="checkbox"/> Grade D: Rejected	<input type="checkbox"/> Major revision

## JOURNAL EDITORIAL BOARD COMMENTS TO AUTHORS

It is a very interesting paper which reports the increasing surgeon experience to be associated with an ever decreasing acetabular cup size for the first time. However, the following questions should be answered before accept for publication. 1. The shape and subchondral bone quality of the acetabular can also influence the degree of reaming in addition to the cup design. 2. It will be more reasonable if the arthroplasty be divided into two different cup design groups, 3. The decrease in cup size to be more evident with decreasing or increasing surgeon experience? 4. In figure 1, Surgeon A performed 10 years arthroplasty, it seems abnormal that the cup size becomes less and less without any plateau. Surgeon C only performed 5 years arthroplasty, the cup sizes he used are much less compared to that of surgeon A, which does not support the conclusion
