

1. The language level of this article has reached Grade A, and the corresponding certificate has been obtained.
2. We measured the acetabular anteversion of 10 during the operation, and added the description of acetabular anteversion in "surgical technique". By measuring the displacement distance of bilateral femoral head, pelvic height and femoral head height, and calculating the corresponding ratio, it is finally determined that the case belongs to type IV in Crowe classification (Figure 1C).
3. I have moved the technical description to the treatment paragraph and changed the title to "Surgical Technology".
4. The limitations and complications of this method are described in the last paragraph, such as muscle and nerve injury, dislocation of hip joint, risk of ischemic necrosis, etc. We revised the discussion paragraph.
5. Seven new references in recent 3 years have been included in this paper.
6. Since the title of the article can't exceed 18 words, we summarized the title of the article.
