Focal liver lesions: Practical magnetic resonance imaging approach

António P Matos, Fernanda Velloni, Miguel Ramalho, Mamdoh AlObaidy,
Aruna Rajapaksha, Richard C Semelka

Abstract

With the widespread of cross-sectional imaging, a growth of incidentally detected focal liver lesions (FLL) has been observed. A reliable detection and characterization of FLL is critical for optimal patient management. Maximizing accuracy of imaging in the context of FLL is paramount in avoiding unnecessary biopsies, which may result in post-procedural complications. A tremendous development of new imaging techniques has taken place during these last years. Nowadays, Magnetic resonance (MR) imaging plays a key role in management of liver lesions, using a radiation-
