

- Will forward signed conflict of interest statement in PDF format
- Shifted images and legends to bottom of paper
- Reformatted references per editor comments
- Fixed formatting of paper per editor comments so that “Question 3” is included before “When are non-surgical liver directed therapies indicated?”
- We elected not to include a flow-chart for the management of NF-PNETs as suggested by one of the editors, as we believe there is no single appropriate algorithm for the management of such patients, and that many factors besides extent of patient disease and location of tumor (patient age, functional status, previous operations and treatments etc.) impact the decision for what the most appropriate management strategy will be.
