The manuscript written by Adam EH describes the hemostatic profile in patients with liver cirrhosis and reported a partially impaired hemostatic profile in those patients. Although thrombocytopenia is well known in those patients, precise analysis of thrombocyte function in association with the severity of liver cirrhosis has not been reported. Therefore, the data are interesting and important.

I don't think the conclusion of that "Therefore, a high MELD score indicating advanced liver cirrhosis does not allow conclusions on the hemostatic profile" is appropriate based on the study. Coagulopathy in advanced cirrhosis is correlated to high MELD score, the mechanisms are beyond the platelet function of hemostasis.
