COMMENTS TO AUTHORS

these figures are reversed. (caused by excessive consumption of alcohol (women ≤ 140 g/week, men ≤ 70 g/week) the 140 gm/week should apply to MEN You should have looked at DIETARY habits such as Western FFD to see its role in NAFLD development and resolution

COMMENTS TO AUTHORS

The work entitled "Eight-Year Follow-Up Study on Chinese Non-Alcoholic Fatty Liver Disease" is aimed to investigate the prevalence and risk factors for NAFLD in a Chinese Population composed by 1948 adults. The aim of this manuscript is of interest and the data presented in it explored all the possible markers related to prevalence and progression to NAFLD in these patients. The data collected are accurate and the results enlightening. I only have minor comments in order to polish the potential World J. Gastroenterology article: 1-A deep language polishing should be performed to improve the quality of the manuscript. 2- Check inconsistency gender vs amount alcohol intake.

COMMENTS TO AUTHORS

The manuscript from Zhen-Ya Lu et al evaluates, in a eight years follow-up study on Chinese population, the prevalence and risk factors for NAFLD. The study is well struttured and scientifically interesting. Thus, I believe that the study may reach the quality for publication in the Journal.
