Endovascular retrieval of a prematurely deployed covered stent

Jefferson T Miley, Gustavo J Rodriguez, Ramachandra P Tummala

Abstract

Several techniques have been reported to address different endovascular device failures. We report the case of a premature deployment of a covered balloon mounted stent during endovascular repair of a post-traumatic carotid cavernous fistula (CCF). A 50 year-old male suffered a fall resulting in loss of consciousness and multiple facial fractures. He five weeks later developed decreased left visual acuity, proptosis, chemosis, limited eye movements and cranial/orbit bruit. Cerebral angiography demonstrated a direct left CCF and endovascular repair with a 5.0x19mm covered stent was planned. Once in the lacerum segment, increased resistance was encountered and the stent was withdrawn resulting in
