Management issues in post living donor liver transplant biliary strictures

Manav Wadhawan, Ajay Kumar

Abstract

Biliary complications are common after living donor liver transplant although with advancements in surgical understanding and techniques, the incidence is decreasing. Biliary strictures are more common than leaks. ERCP is the first line modality of treatment of post LDLT biliary strictures with a technical success rate of 75-80%. Most of ERCP failures are successfully treated by PTBD and rendezvous technique. A minority of patients may require surgical correction.
