Treatment strategies for <sup>18</sup>chronic hepatitis C prior to and following liver transplantation

Ryan B Perumpail, Thomas A Hahambis, Avin Aggarwal, Zobair M Younossi, Aijaz Ahmed

## Abstract

<sup>5</sup>Hepatitis C virus (HCV)-related liver disease is the leading indication for liver transplantation (LT) worldwide. However, HCV is an independent predictor of lower survival following LT, and recurrence of HCV post-LT is virtually universal. The historic standard of care during the interferon era of HCV therapy was expectant management—initiation of antiviral therapy in the setting of documented disease progression following liver transplantation. With the advent of new <sup>3</sup>direct acting antiviral (DAA) therapies for HCV, the paradigm of expectant treatment for recurrent HCV infection post-LT is shifting. The safety, tolerability, and efficacy of DAAs, even among the sickest patients with advanced liver disease, enables treatment of HCV in the pre-transplant setting among LT waitlist registrants. Finally, emerging data are supportive of preemptive therapy with DAA in liver transplant recipients as the preferred
