#### Abstract

The role of endoscopic procedures, in both diagnostic and therapeutic purposes, is continually expanding and evolving rapidly. In this context, endoscopists will encounter patients prescribed on anticoagulant and antiplatelet medications frequently. This poses an increased risk of intraprocedural and delayed gastrointestinal bleeding. Thus, greater importance on optimal pre, peri and post-operative management of anticoagulant and antiplatelet use is important to minimise the risk of post-procedural bleeding, without increasing the risk of a thromboembolic event, as a consequence of therapy interruption. There are currently position statements and guidelines from the major gastroenterology societies available to assist endoscopists with an evidenced-based systematic approach to anticoagulant and/or antiplatelet management in
