Helicobacter pylori recurrence after eradication in Latin America: Implications for gastric cancer prevention

Juan E Corral, Robertino Mera, Corey W Dye, Douglas R Morgan

Abstract

Aim: To estimate *H. pylori* recurrence rate in Latin America, a region with a significant *H. pylori* prevalence and gastric cancer burden.

Methods: Pubmed, LILACS, SciELO, Cochrane databases and abstracts from relevant meetings were reviewed. Information collected included: participants' characteristics, recruitment strategy, diagnostic modality, treatment arms, follow-up and recurrence rates. Recurrence was calculated using 100-patients-year rates, and data were pooled using a random effects model. The I² statistic assessed between study heterogeneity. Meta-regression analyses evaluated for effect modifying variables.

Results: Literature search yielded 163 articles. 12 studies involving 4,848 patients from 9 countries met inclusion criteria. 432 reinfections were recorded in 5,487 person-years of follow-up. Pooled analysis showed a recurrence rate of 7.9 cases per 100 person-years
