Molecular mechanisms of peritoneal dissemination in gastric cancer

Mitsuro Kanda, Yasuhiro Koderu

Abstract

Peritoneal dissemination represents a devastating form of gastric cancer (GC) progression with a dismal prognosis. There is no effective therapy for this condition. The 5-year survival rate of patients with peritoneal dissemination is 2%, even including patients with only microscopic free cancer cells without macroscopic peritoneal nodules. The mechanism of peritoneal dissemination of GC occurs through several steps: detachment of cancer cells
