## COMMENTS TO AUTHORS

In this article, the authors reviewed the pattern of hemostatic abnormalities in children with end-stage liver disease and summarized the point-of-care coagulation monitoring, the clinical strategies to reduce bleeding/thrombosis in PLTx and the future areas of investigation in this pediatric field. It is interesting and provides important information. However, the article looks clumsy and difficult to understand. Authors should mention the current up-to-date management strategies to the readers and provide suggestions and advice for further research directions.

## COMMENTS TO AUTHORS

The authors face the relevant issue of coagulopathy and transfusion therapy in pediatric liver transplantation. The manuscript is well written and complete. All the aspects have been taken in account, including proposals for therapy. The english only need a minor revision. The introduction is too long. Should be restrained to two, three phrases, all other points should be moved to other chapters
