Dental management of a patient with Moebius syndrome: A case report

Ben Chen, Ling-Xia Li, Li-Li Zhou

Abstract

BACKGROUND

Moebius syndrome (MBS) is a nonprogressive and rare congenital neuromuscular disorder involving the facial nerve and abductor nerve; it mainly manifests as facial paralysis and eye strabismus paralytic symptoms. Tissues in the oral cavity are also

Möbius syndrome

Neurological Disorder

Symptoms

Diagnosis

Causes

Treatments

>

Möbius syndrome is a rare congenital neurological disorder which is characterized by facial paralysis and the inability to move the eyes from side to side. Most people with Möbius syndrome are born with complete facial paralysis and cannot close their eyes or form facial expressions. Limb and chest wall abnormalities sometimes occur with the syndrome. People with Möbius syndrome have normal intelligence, although their lack of facial expression is sometimes incorrectly taken to be due to dullness or unfriendliness. It is named for Paul Julius Möbius, a German neurologist who first described the syndrome in 1888. Möbius syndrome was first set up and registered as a charity in 1999 by a mother in the UK. Linda Anderson from Tyne and Wear, set the charity up after her son was born with the condition in 1980 and little was known of the condition. She campaigned for many years, held conferences and gave medical speeches in American before she was forced to step away from the charity due to ill health.
