COMMENTS TO AUTHORS

The authors presented a unique study evaluating the 30-year treatment outcomes associated with Budd-Chiari syndrome at a tertiary hospital in China with a good analysis of the results. It is known that the selection of treatment modalities for Budd-Chiari syndrome different between China and Western countries. Interventional radiology is the most common treatment modality for Budd-Chiari syndrome in China. This method was the main one in the presented study (mainly percutaneous transluminal angioplasty with or without stent implantation). The chosen therapeutic approach allowed to achieve good results. The present study is limited by its retrospective design and inclusion of patients from a single institution. However, it was performed on a large number of patients.
