Liver transplantation for recurrent posthepatectomy malignant hepatic angiolipoma: A case report

Wen-Tao Wang, Zi-Qiang Li, Gui-Hui Zhang, Yuan Guo, Mu-Jian Tang

#### Abstract

Hepatic angiolipomas (AMLs) are typically benign tumors containing varying amounts of smooth muscle cells, adipose tissue, and vessels, and are commonly found in the kidney and occasionally in the liver. The preoperative diagnosis of hepatic AML is primarily made from imaging and fine-needle aspiration biopsy results, though limited experience for such diagnoses can result in misdiagnosis. Some uncommon features of hepatic AML have been reported in the literature
