COMMENTS TO AUTHORS

This research sheds lights on the dietary and nutritional treatment of pouch patients and pouchitis. The contents of this research inform us that dietary differences exist between pouch patients and sex-age matched controls as well as between pouch patients with or without pouchitis. This manuscript is a meaningful and enlightening study in general because it reveals the dietary differences between pouch patients and controls as well as between patients with or without pouchitis, which sheds lights on further investigation on this topic.

COMMENTS TO AUTHORS

Thank you for your research for pouchitis & diet. I recommend to you several things. 1. Would you comment on the patients' selection of food consumption by effects of bowel habit change such as diarrhea or tenesmus due to pouchitis? 2. Do you think you can reverse the pouchitis after consumption of more fruit and vegetable with more antioxidant and/or vitamin? I expect the results of your next researches about the effect of diet consumption on the development of pouchitis.
