Hepatitis ⁴²C virus reinfection after liver transplant: new chances and new challenges in the era of direct-acting antiviral agents

Kerstin Herzer, Guido Gerken

Abstract

The first interferon-free regimens are currently being approved for the treatment of patients with chronic hepatitis C virus (HCV). In the liver transplant (LT) setting, these regimens are expected to have an important effect, because graft loss due to HCV recurrence is a serious problem after LT. The response to the hitherto conventional treatment with pegylated interferon and ribavirin is poor. The
