Autologous platelet-rich-fibrin-induced revascularization sequelae: Two case reports

Eltawila M Ahmed, El Backly M Rania

Abstract

BACKGROUND

A key requirement for biomimetic regeneration of tissues is a 3D scaffold. The gold standard scaffold for revascularization is *the blood clot*, however, an adequate blood clot cannot always be achieved in narrow canals or mature roots. Hereby, we document the effects of platelet-rich fibrin (PRF) for the regenerative endodontic treatment (RET) of two immature permanent teeth with necrotic pulps for up to 48 months
