## COMMENTS TO AUTHORS

The authors present a well-written review article about an important T-cell subtype. It would significantly improve the usefulness of the review if the authors could add information about mechanism (in various sections - such as viral infection, fibrosis etc. ) through which this T-cell subtype contributes to either disease process or protection of the liver. Also, if the authors could highlight the important references, that would benefit the reader immensely. Further, adding disease information to the figure too will add value to the manuscript.

## COMMENTS TO AUTHORS

This is a very well-written review paper summarizing the current state of knowledge on the role of gamma-delta T cells in liver diseases even though the title appeared restrictive to inflammatory and fibrotic diseases of the liver. The paper provides a clear and concise overview of the role of these cells in the pathogenesis of liver pathologies and discusses the potential protective effects of these cells. The paper referred to some of the most recently published papers in the field.
